Do Time of Day and Developer Experience Affect Commit Bugginess?

Jon Eyolfson, Lin Tan, Patrick Lam

University of Waterloo

May 22, 2011

Outline

Goal

- Find correlation between commit "bugginess" vs time-of-day, day-of-week and experience/commit frequency of developers
- Perhaps build prediction models to identify bugs or better allocate developer time
- Construct and make available database of bug introducing/fixing commits with useful metadata

Example

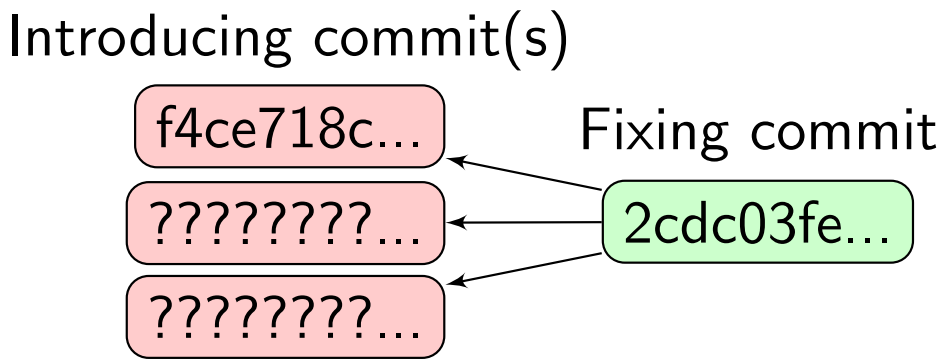
Bug-fixing commit

```
Commit: 2cdc03fe...
Author: Alice <alice@project.com>
Message: I fixed a bug!
@@ -100,1 +100,1 @@
-     if (i <= 128) {
+     if (i < 128) {
```

Blame of previous version

```
f4ce718c...   100     if (i <= 128) {
```

Creating Connections



- Find the bug fixing commits using a keyword search for "fix"
- Keyword search precision of 86%–87% and recall of 71%–73%

Definition

A "buggy" or introducing commit is a commit changed by at least one fixing commit

Additional Information

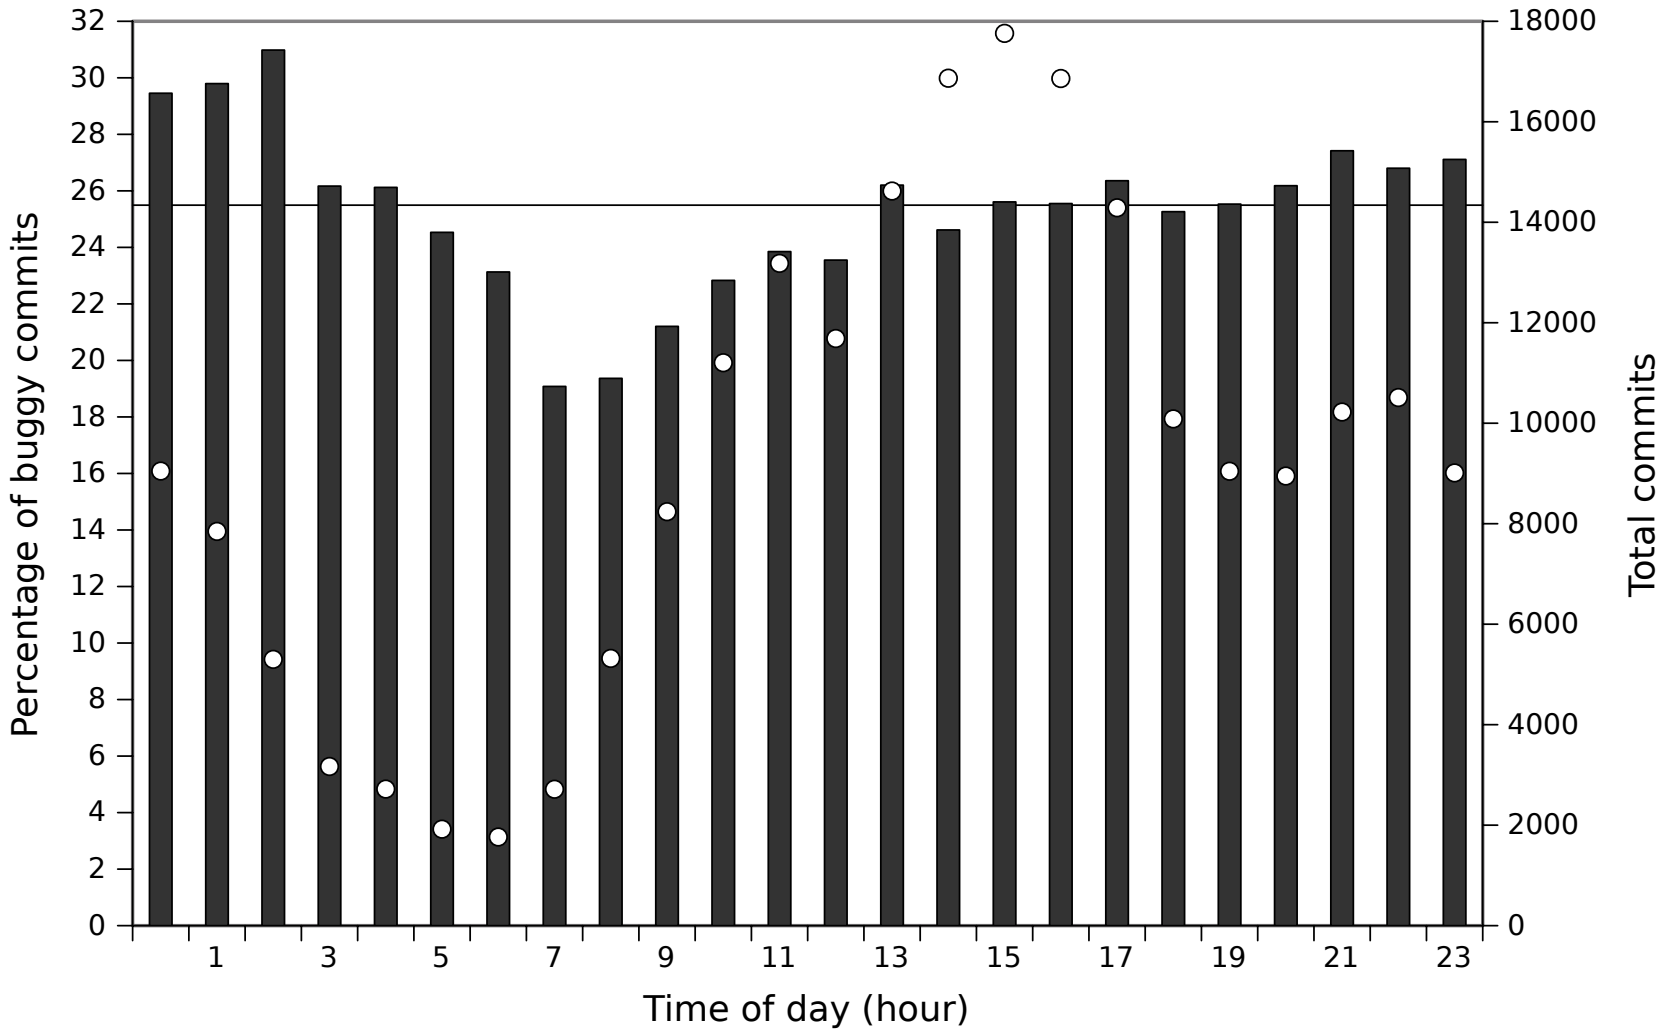
- Record the following
  - Commit times (local and UTC)
  - Number of lines changed in code/comments/other in commit
  - Merge authors with same name/email
- We can now determine
  - Developer experience
  - Bug lifetime
  - Whether a commit contains a bug and how many fixes were applied

Repositories

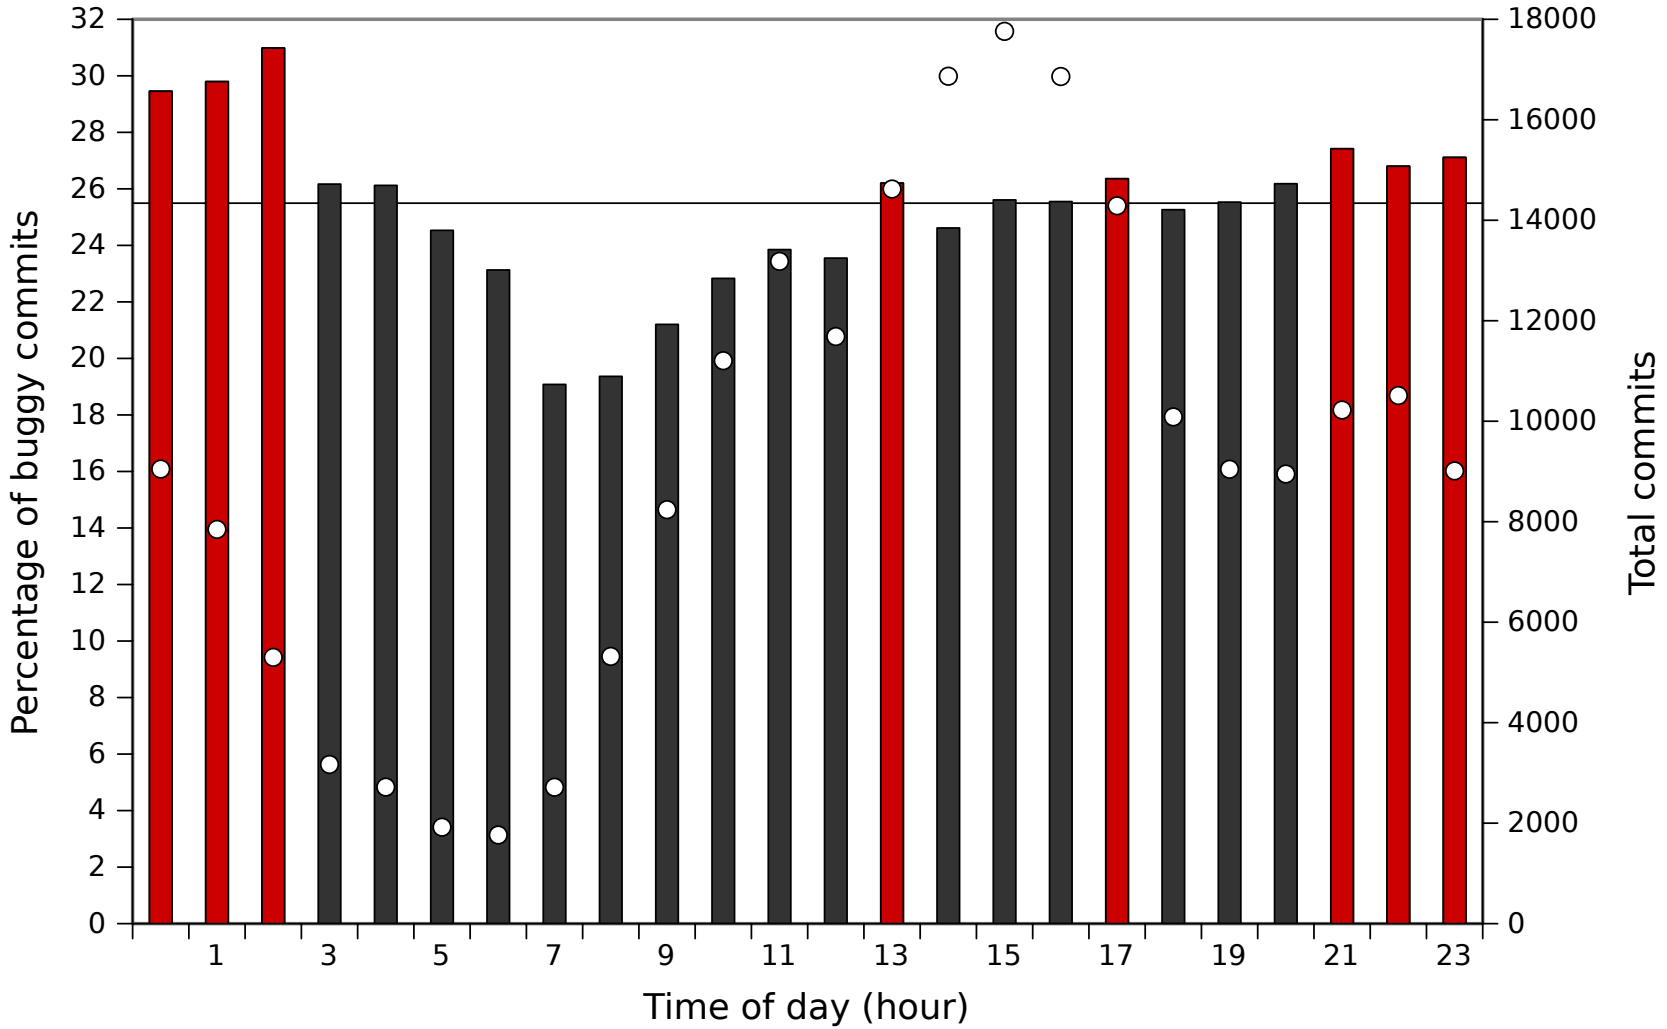
	Linux kernel	**PostgreSQL**
First commit	April 16, 2005	July 9, 1996
Last commit	Nov. 21, 2010	Jan. 24, 2011
Lines of code	over 5 million	over 750,000
Number of authors	6,504	34
Total commits	222,332	31,098
Introducing commits	56,590 (25.5%)	7,388 (23.8%)
Fixing commits	61,044	6,578

- Note: these are the up-to-date results at `http://www.eyolfson.com/scc/`

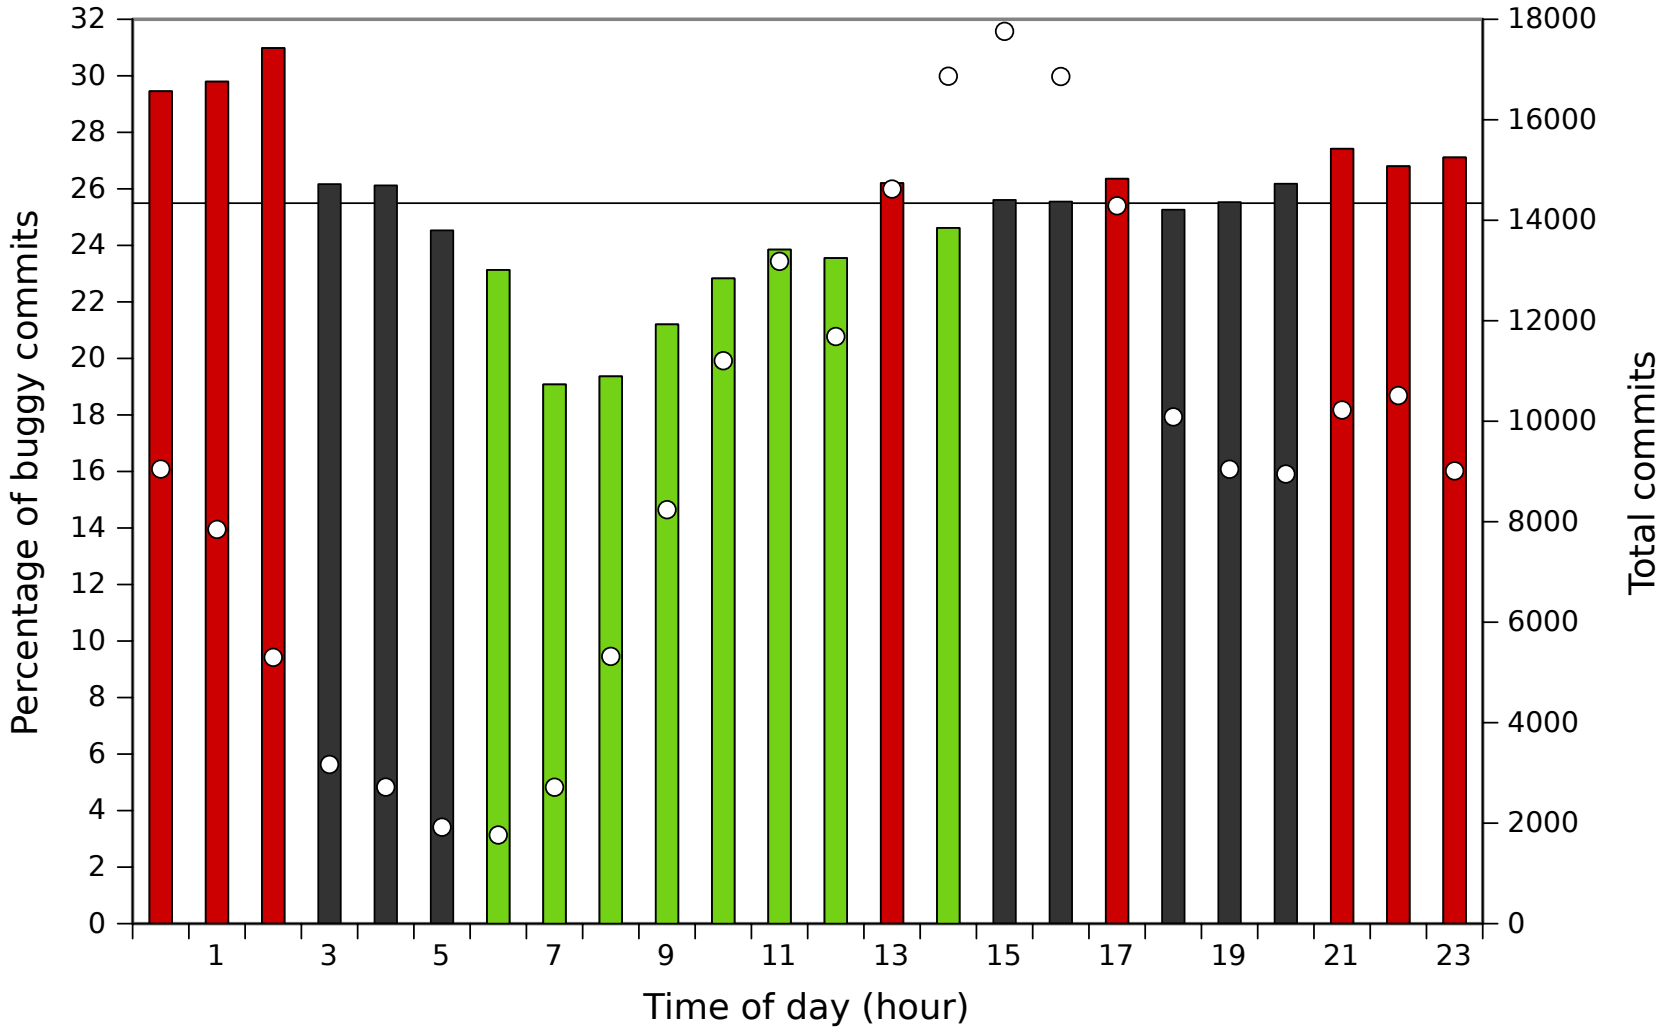
Does Time-of-day Affect Linux?



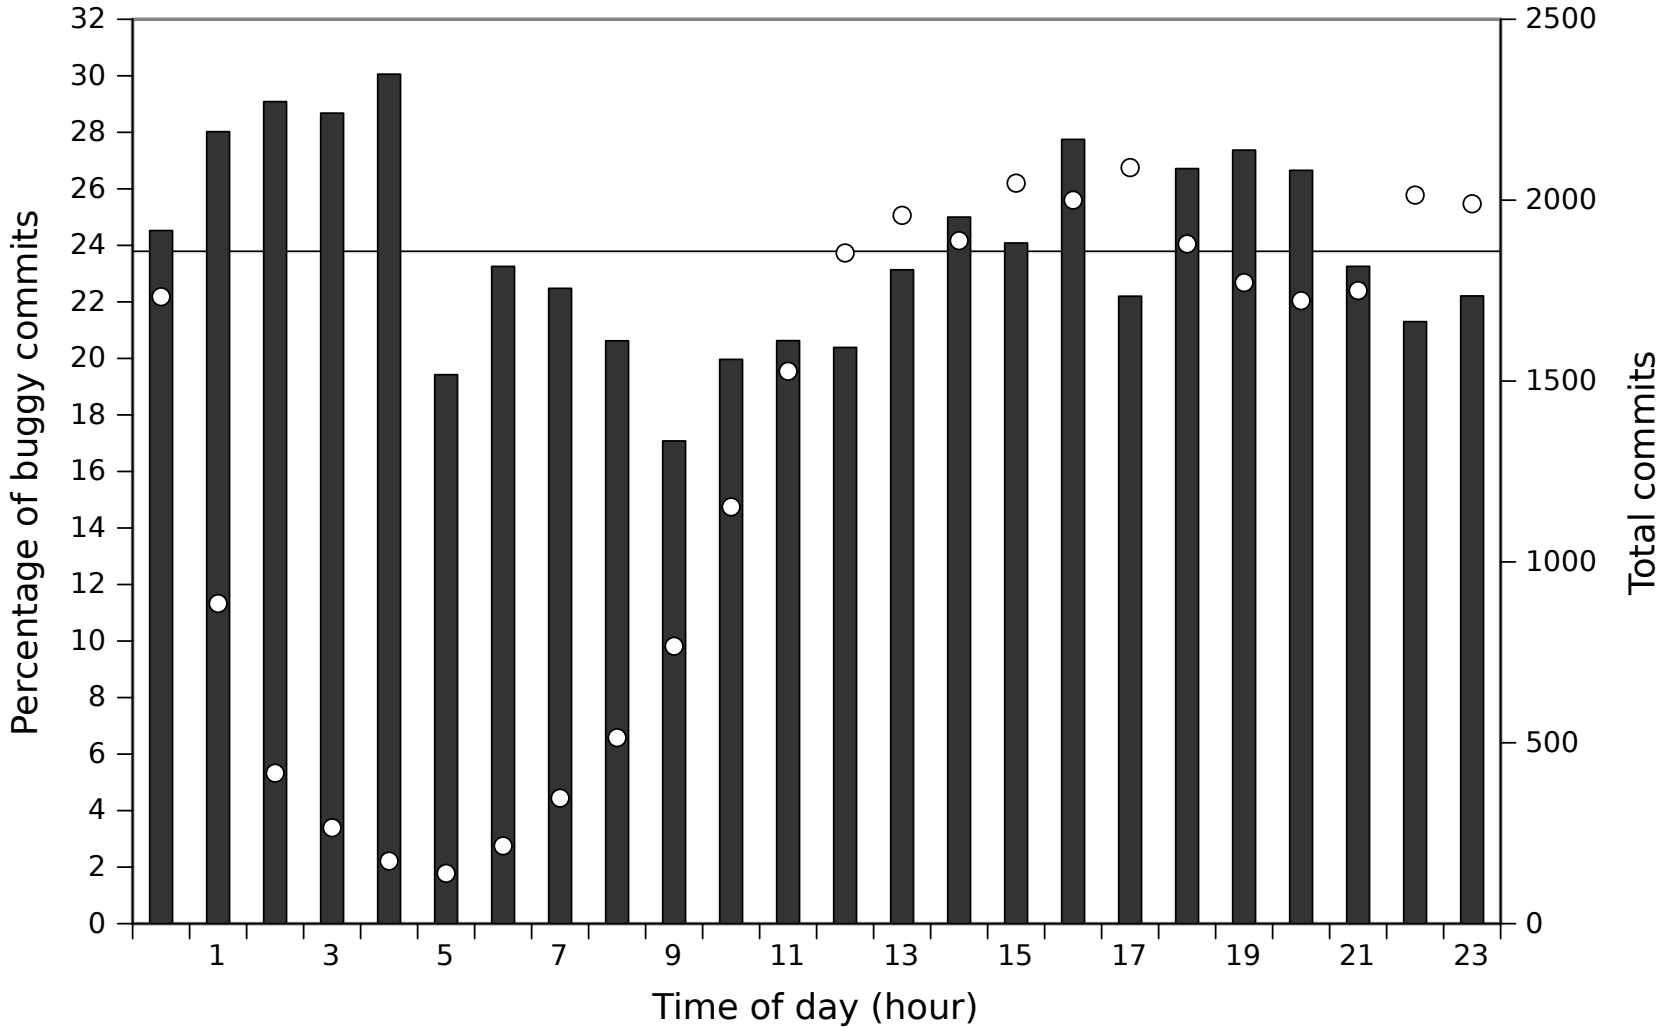
Linux Late Night Commits are 20% More Buggy



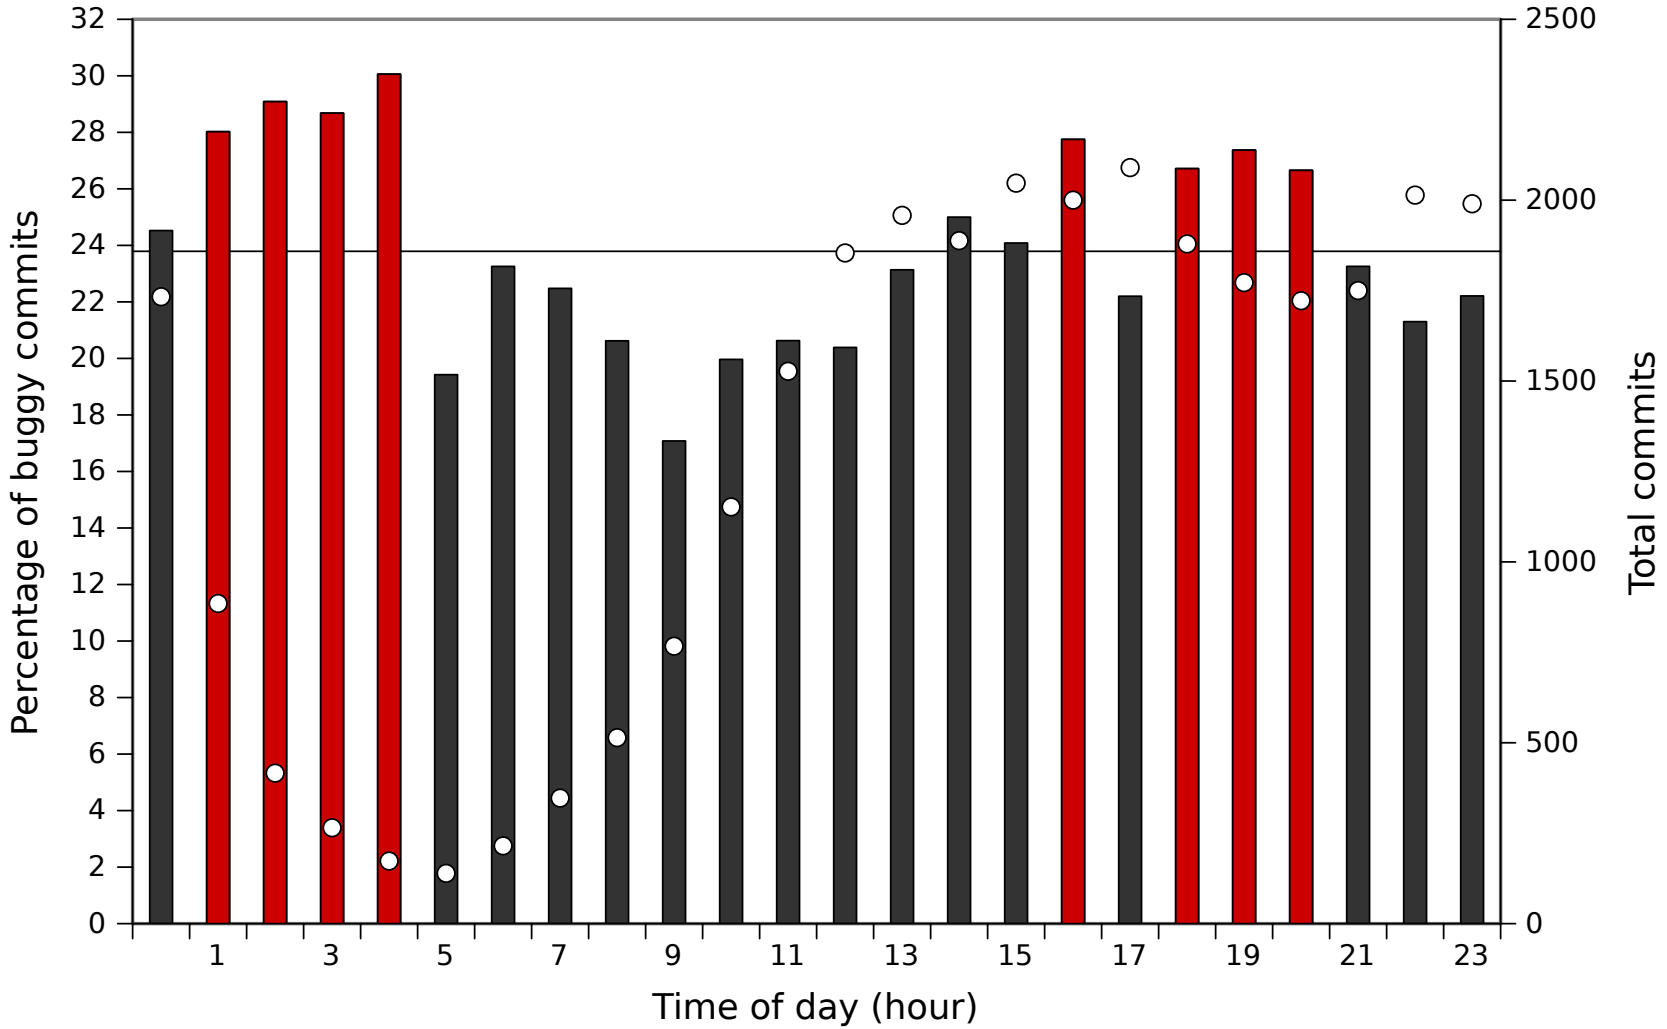
Linux Early Morning Commits Produce 25% Fewer Bugs



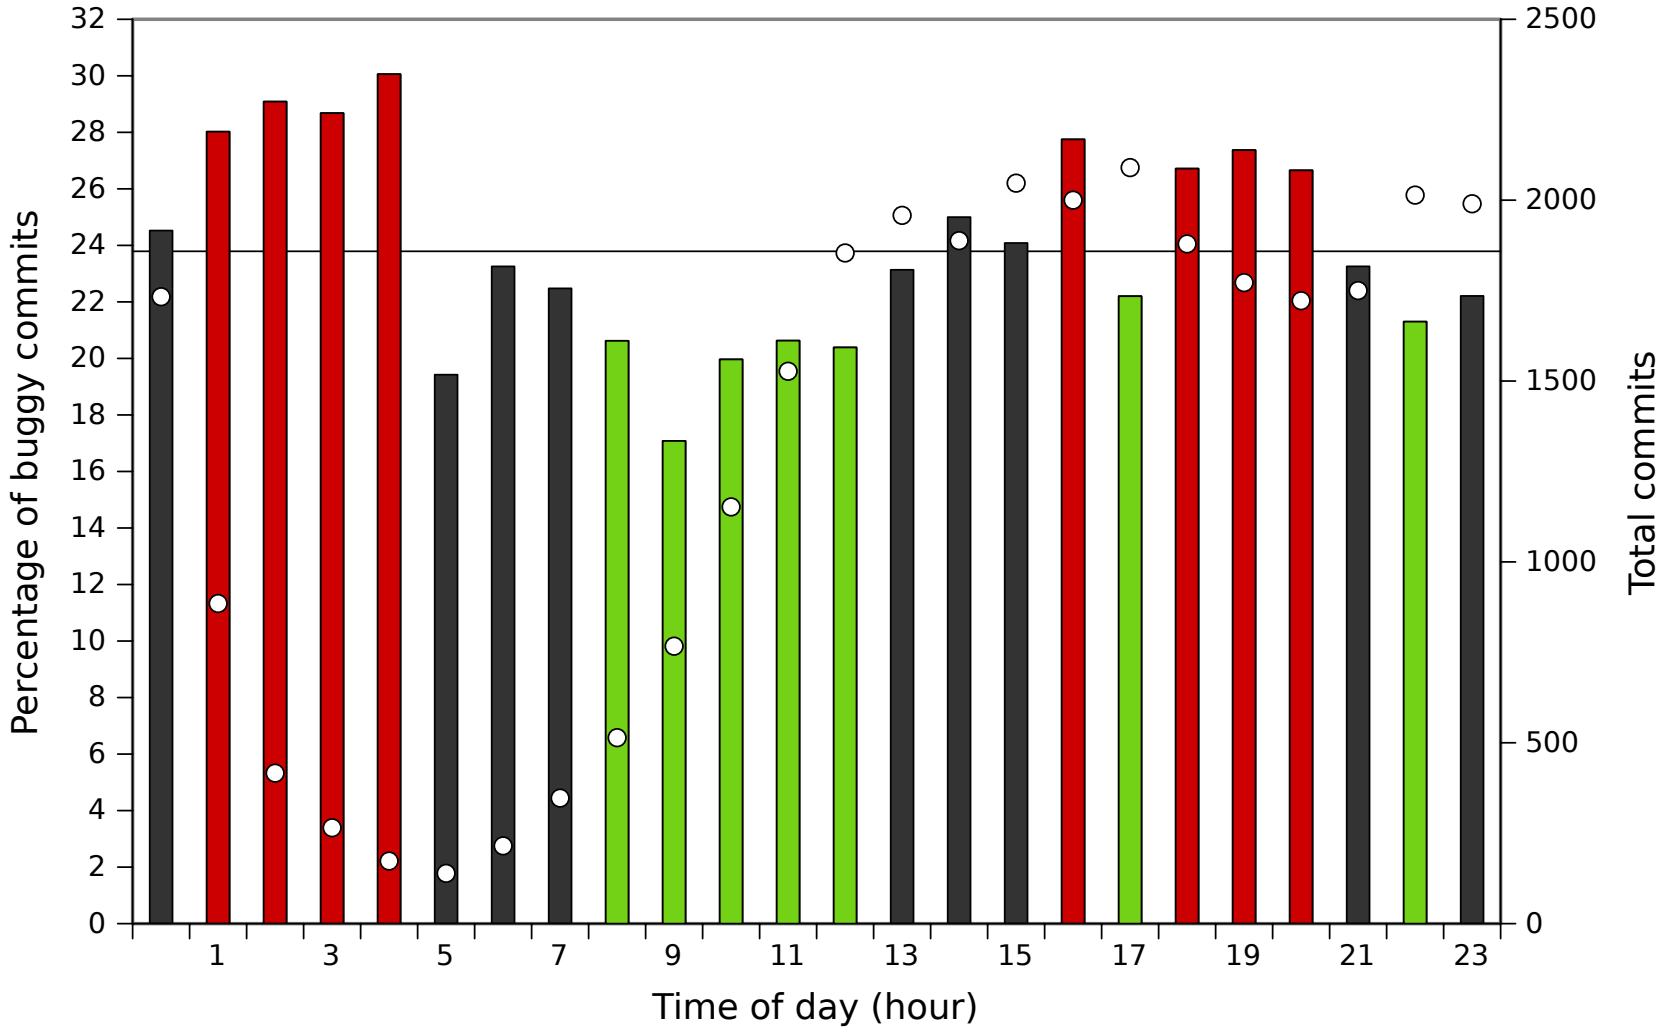
What About Time-of-day and PostgreSQL?



Similarity Late Night Commits are 26% More Buggy



Also Early Morning Commits Produce 27% Fewer Bugs



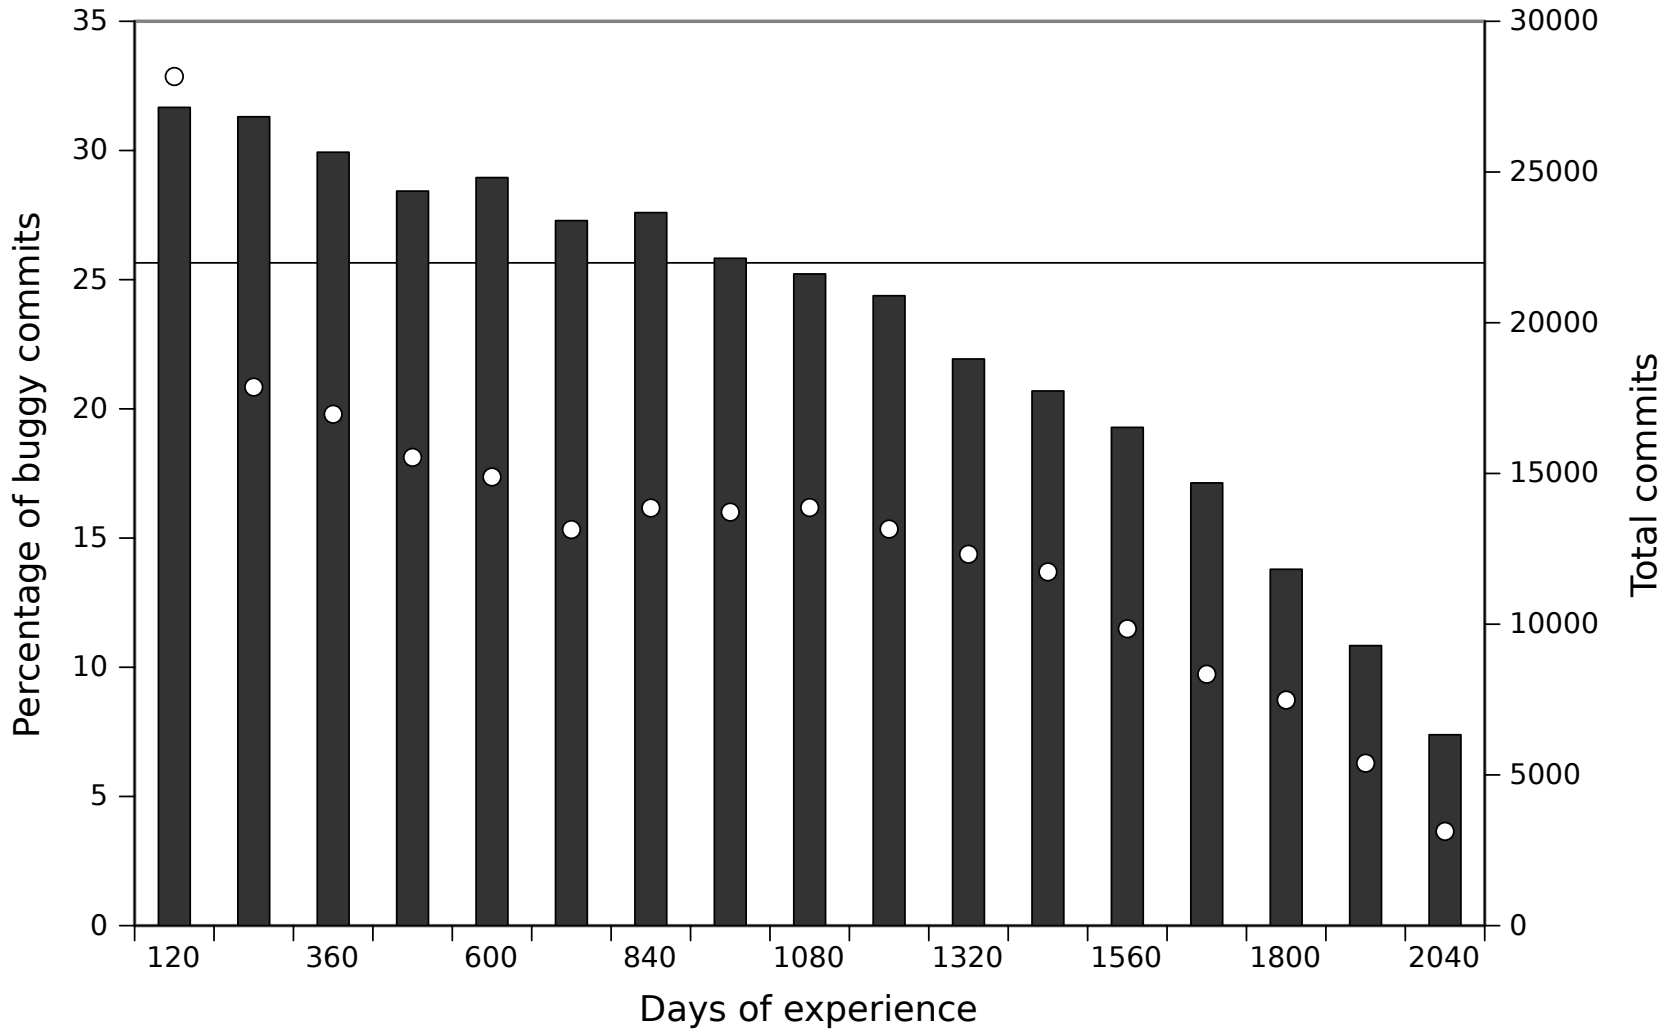
What Is Experience?

Definition

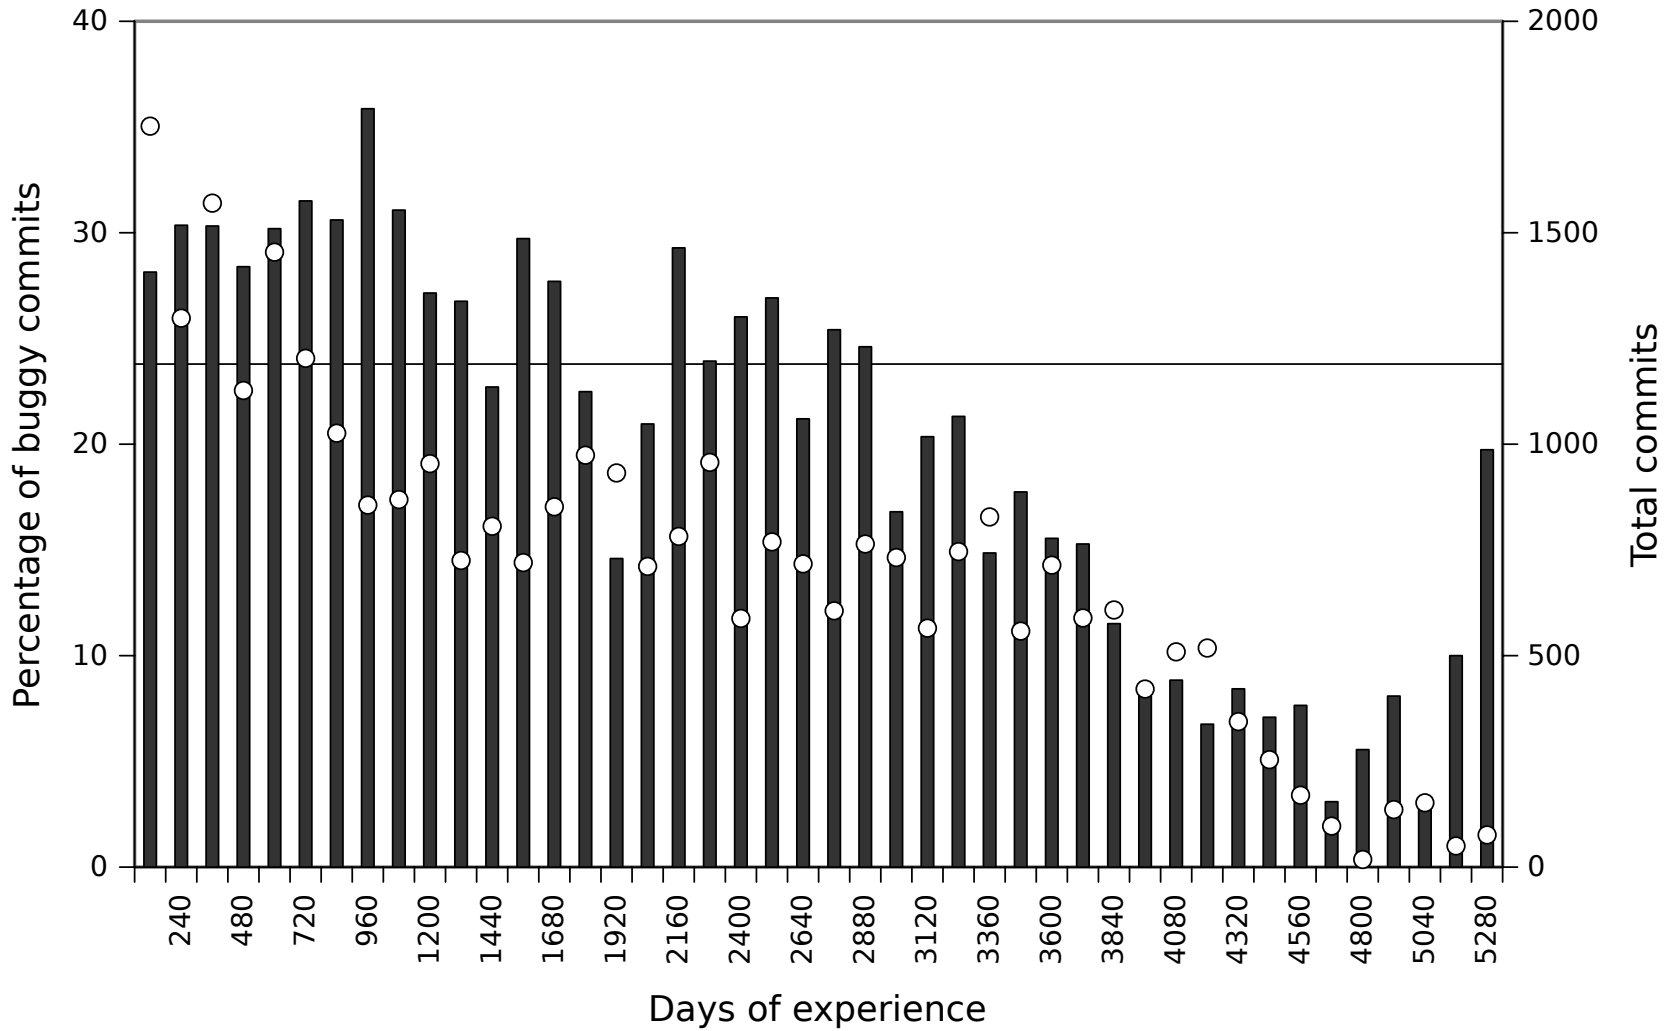
Experience is the number of days from the author's first commit to the current commit

- Consider two of an author's commits who started on May 1st
  - May 1st
  - May 22nd
- First commit would be 0 days experience and second 21 days

Do Experienced Linux Developers Commit Fewer Bugs?



Does PostgreSQL Follow the Same Trend?



Classifications

- Based on frequency
- Daily, weekly, monthly, single

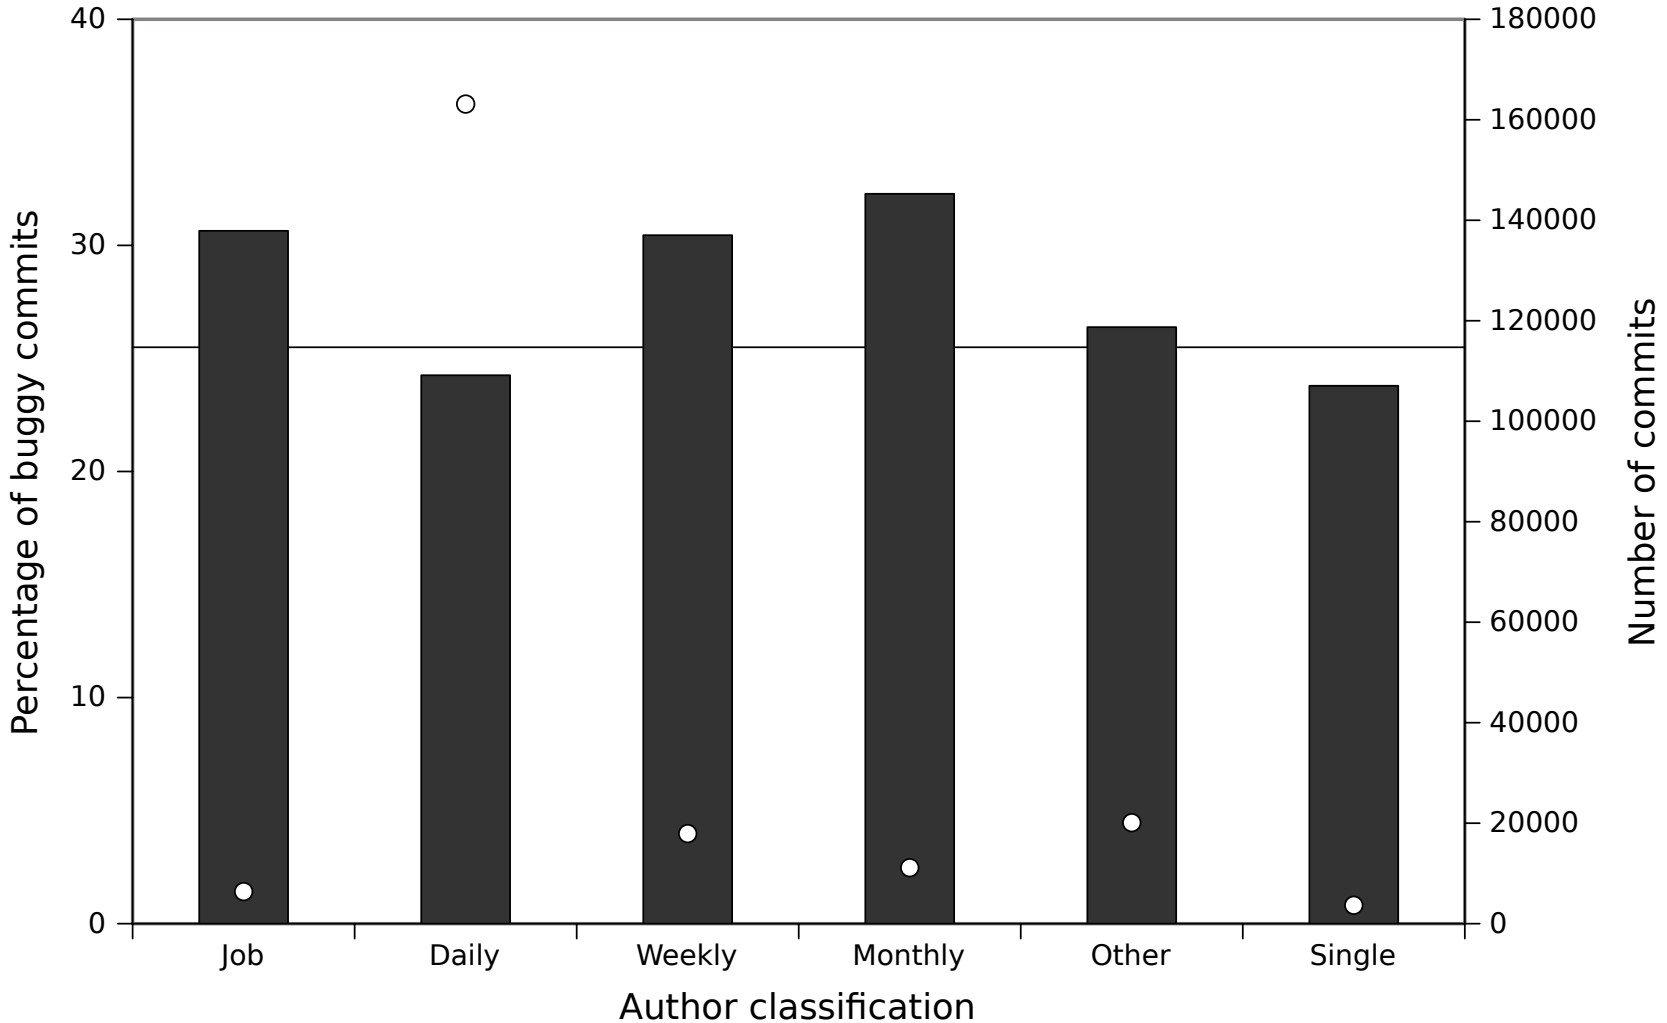
Definition

"Job" is a daily committer with the majority of commits between working hours

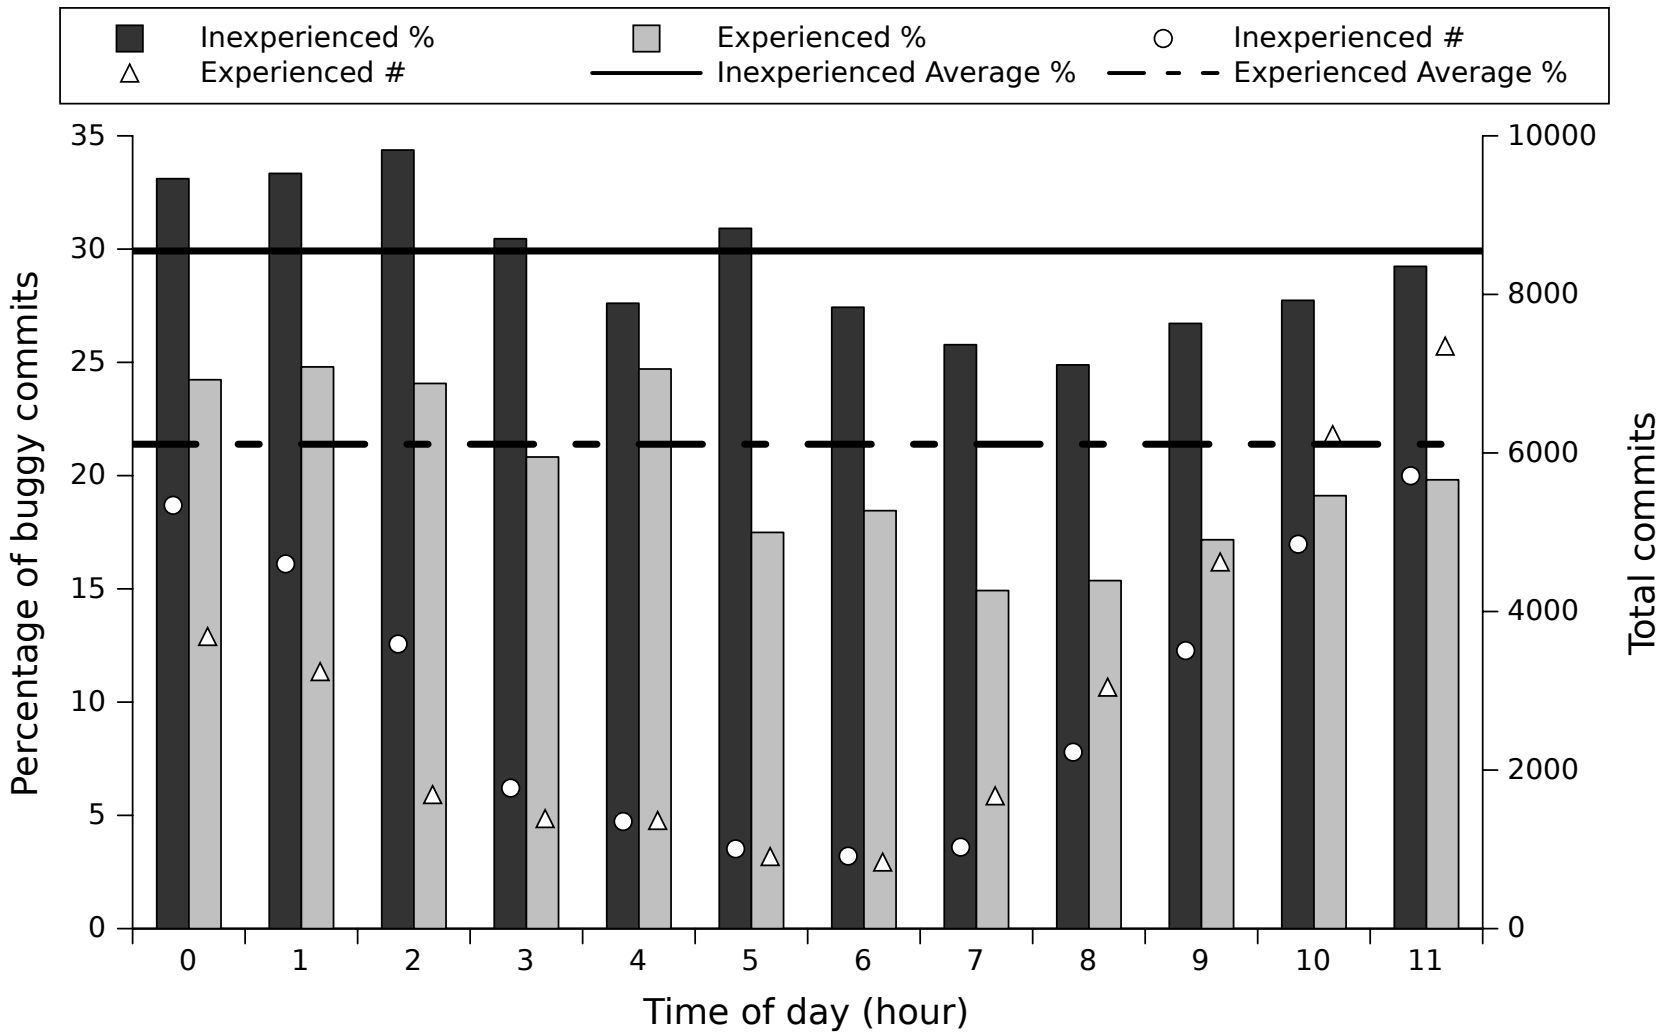
Definition

"Other" is a committer with fewer than 20 commits

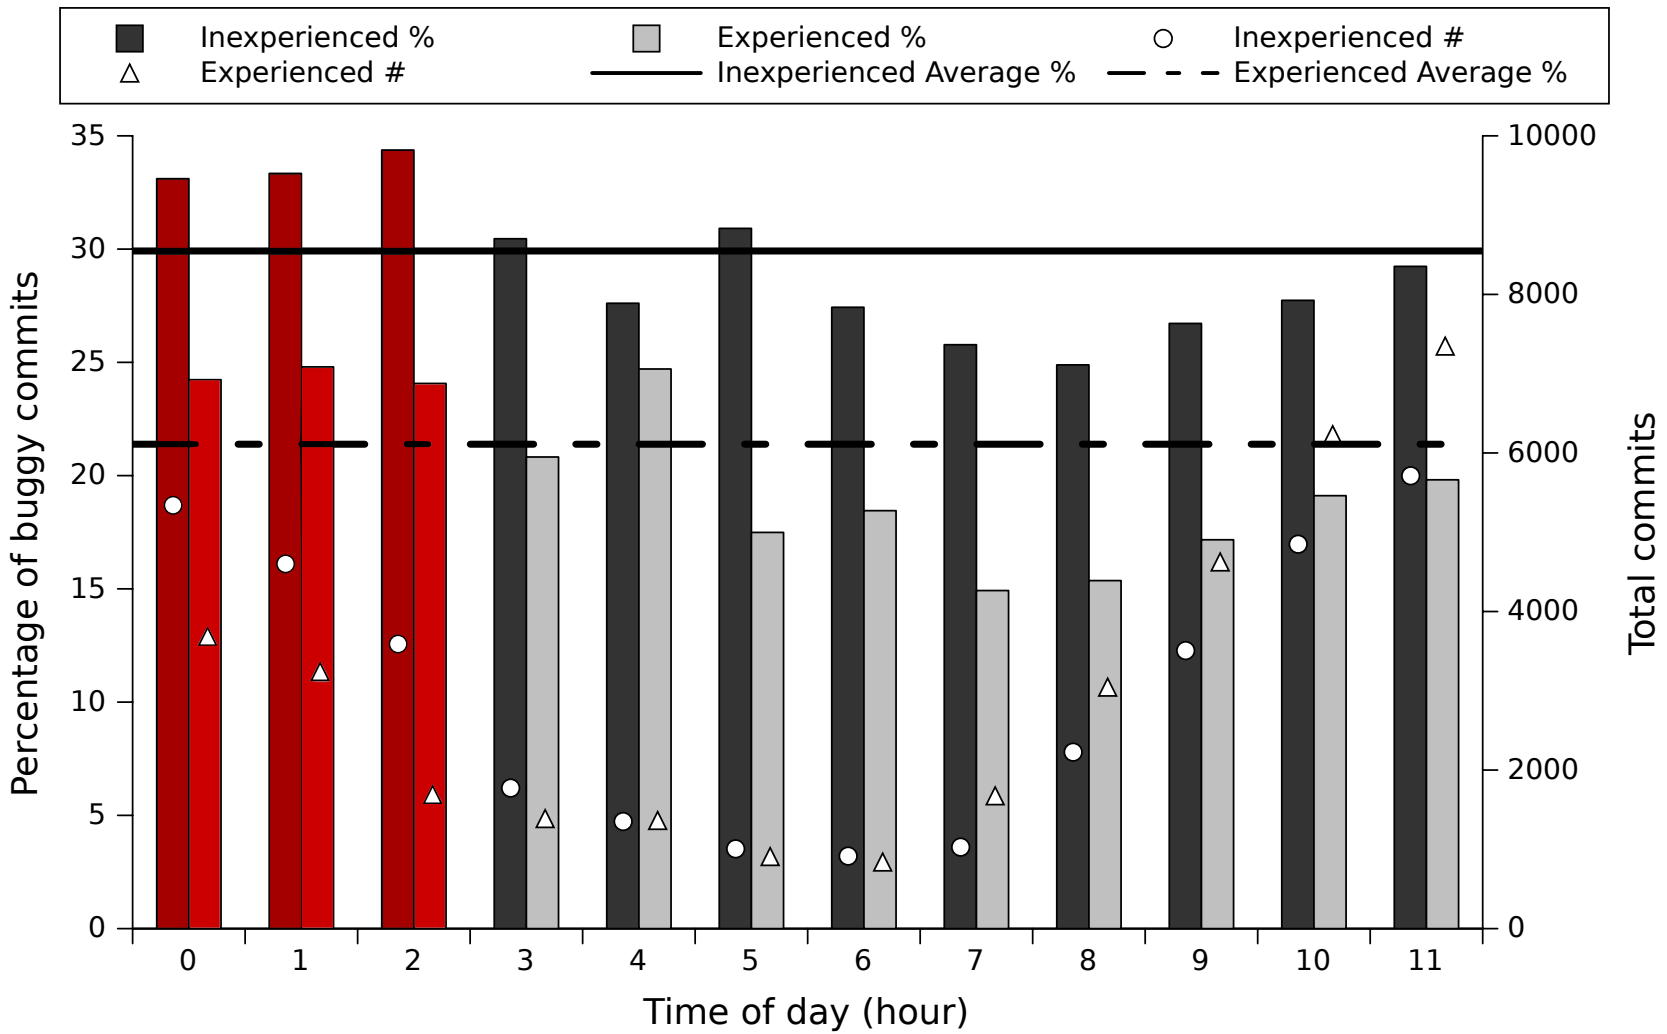
Does Developer Activeness Matter for Linux?



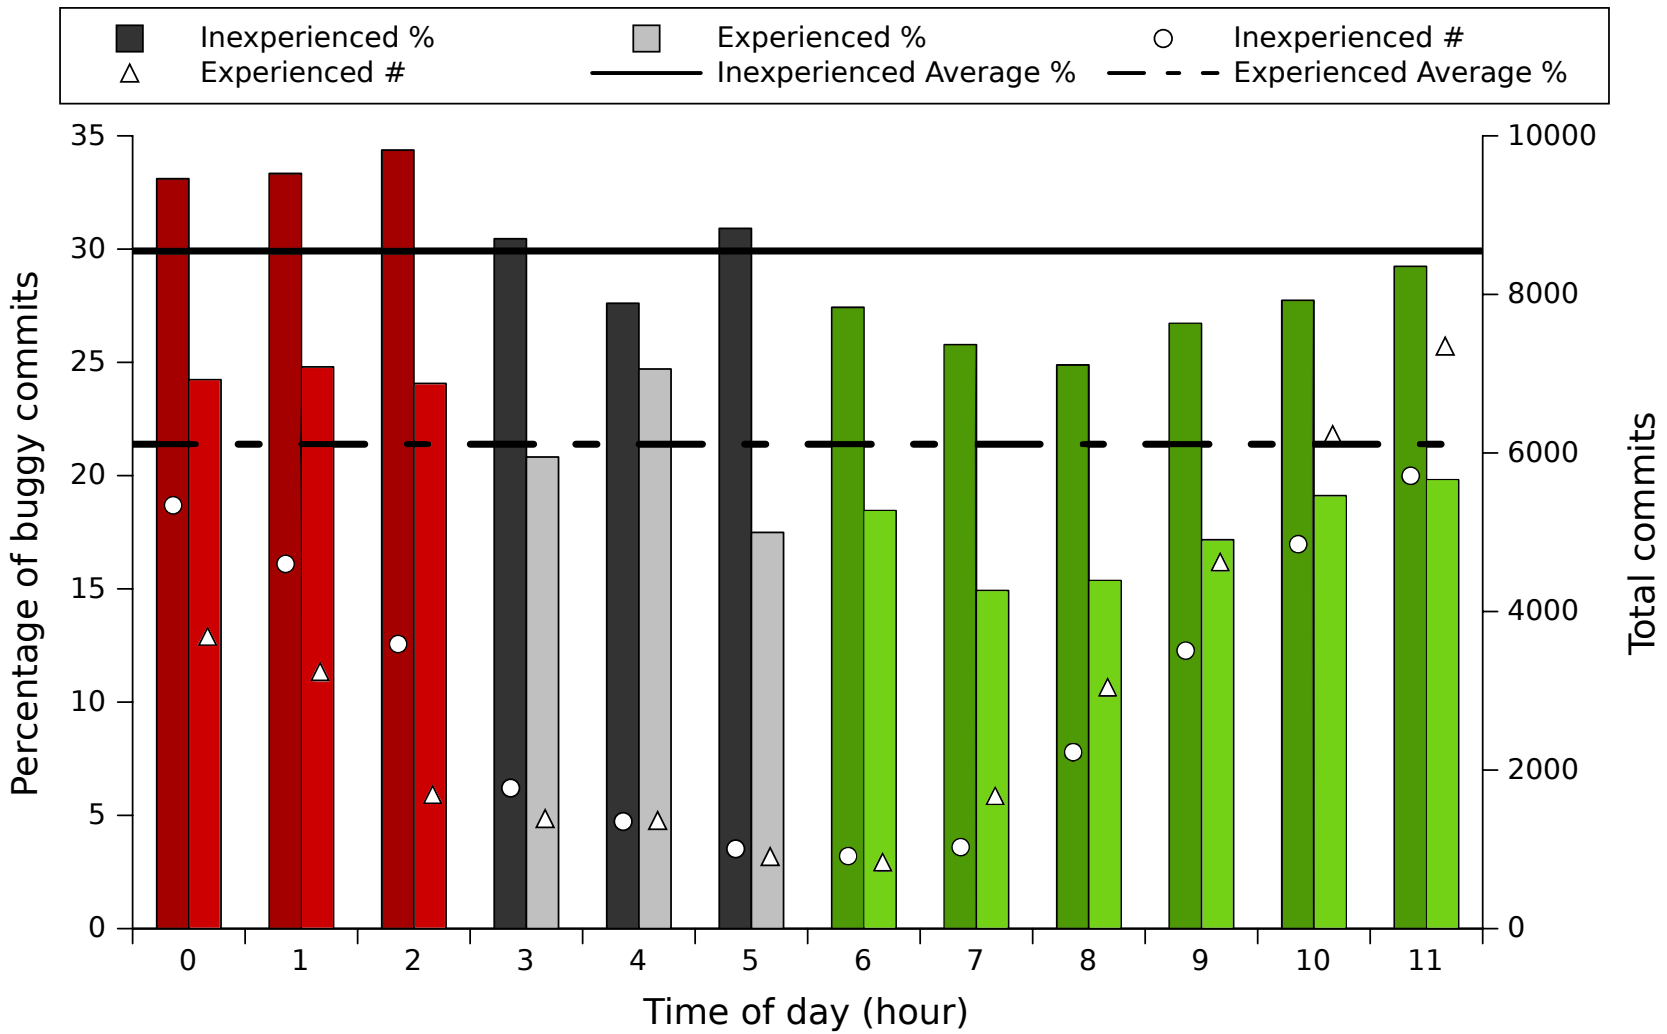
Differences for Inexperienced and Experienced Linux Developers (1)



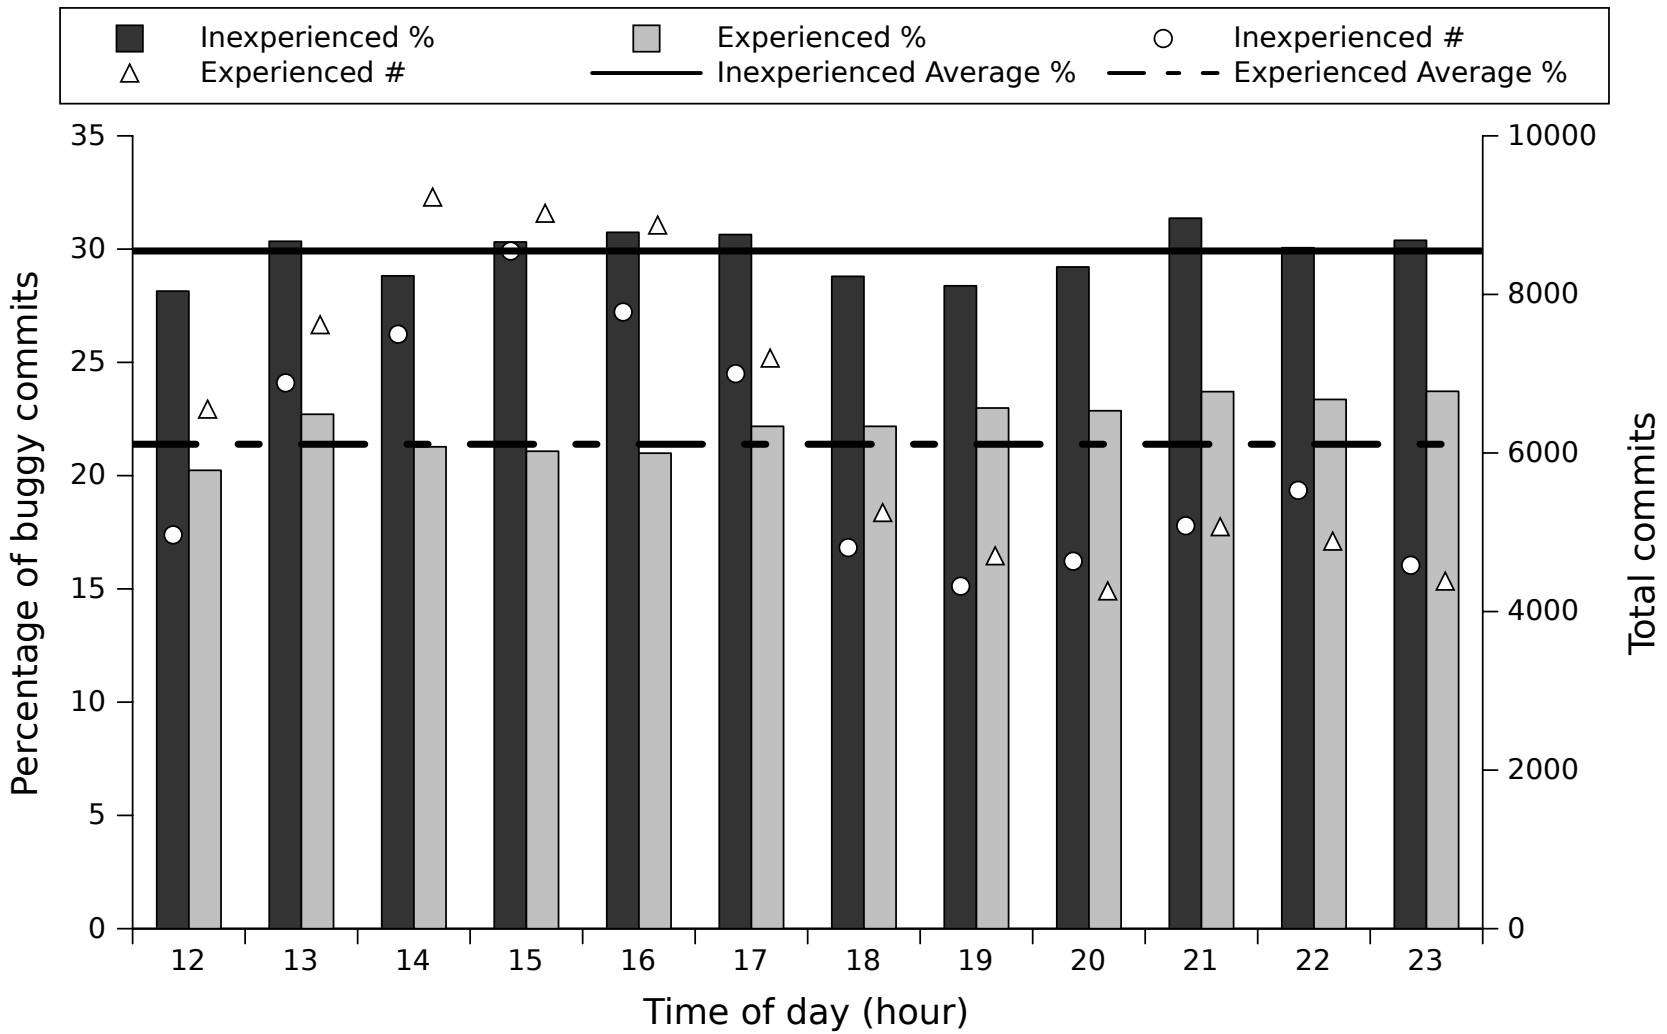
Differences for Inexperienced and Experienced Linux Developers (1)



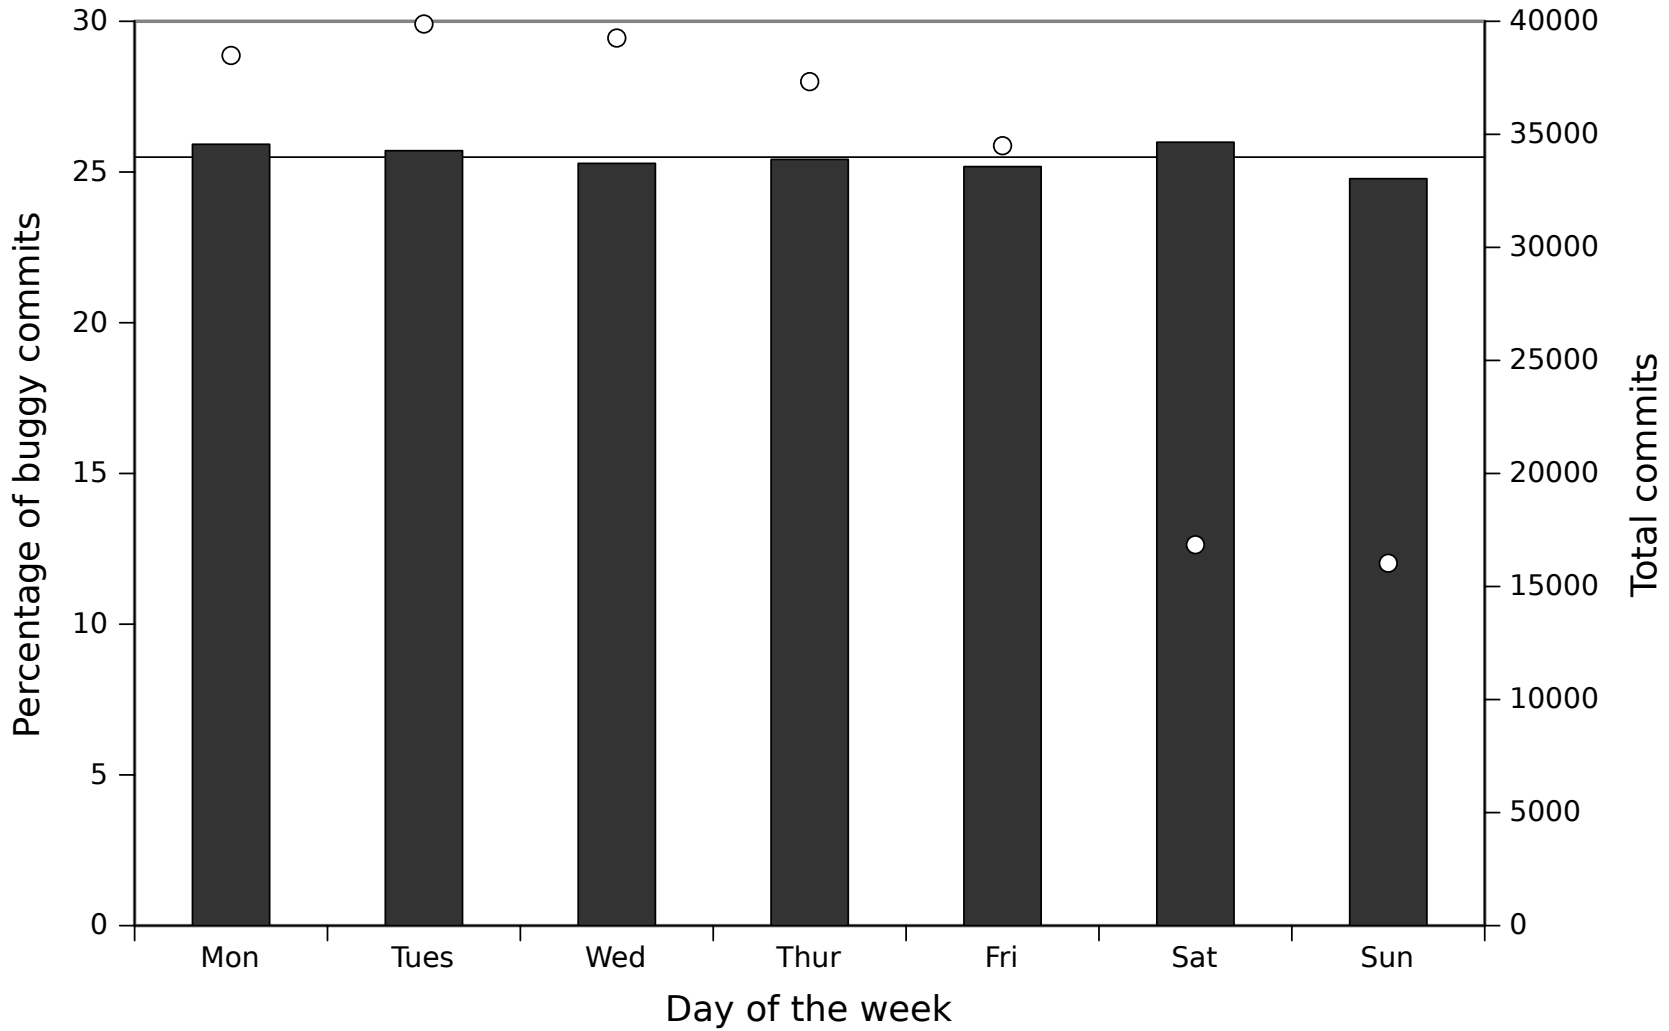
Differences for Inexperienced and Experienced Linux Developers (1)



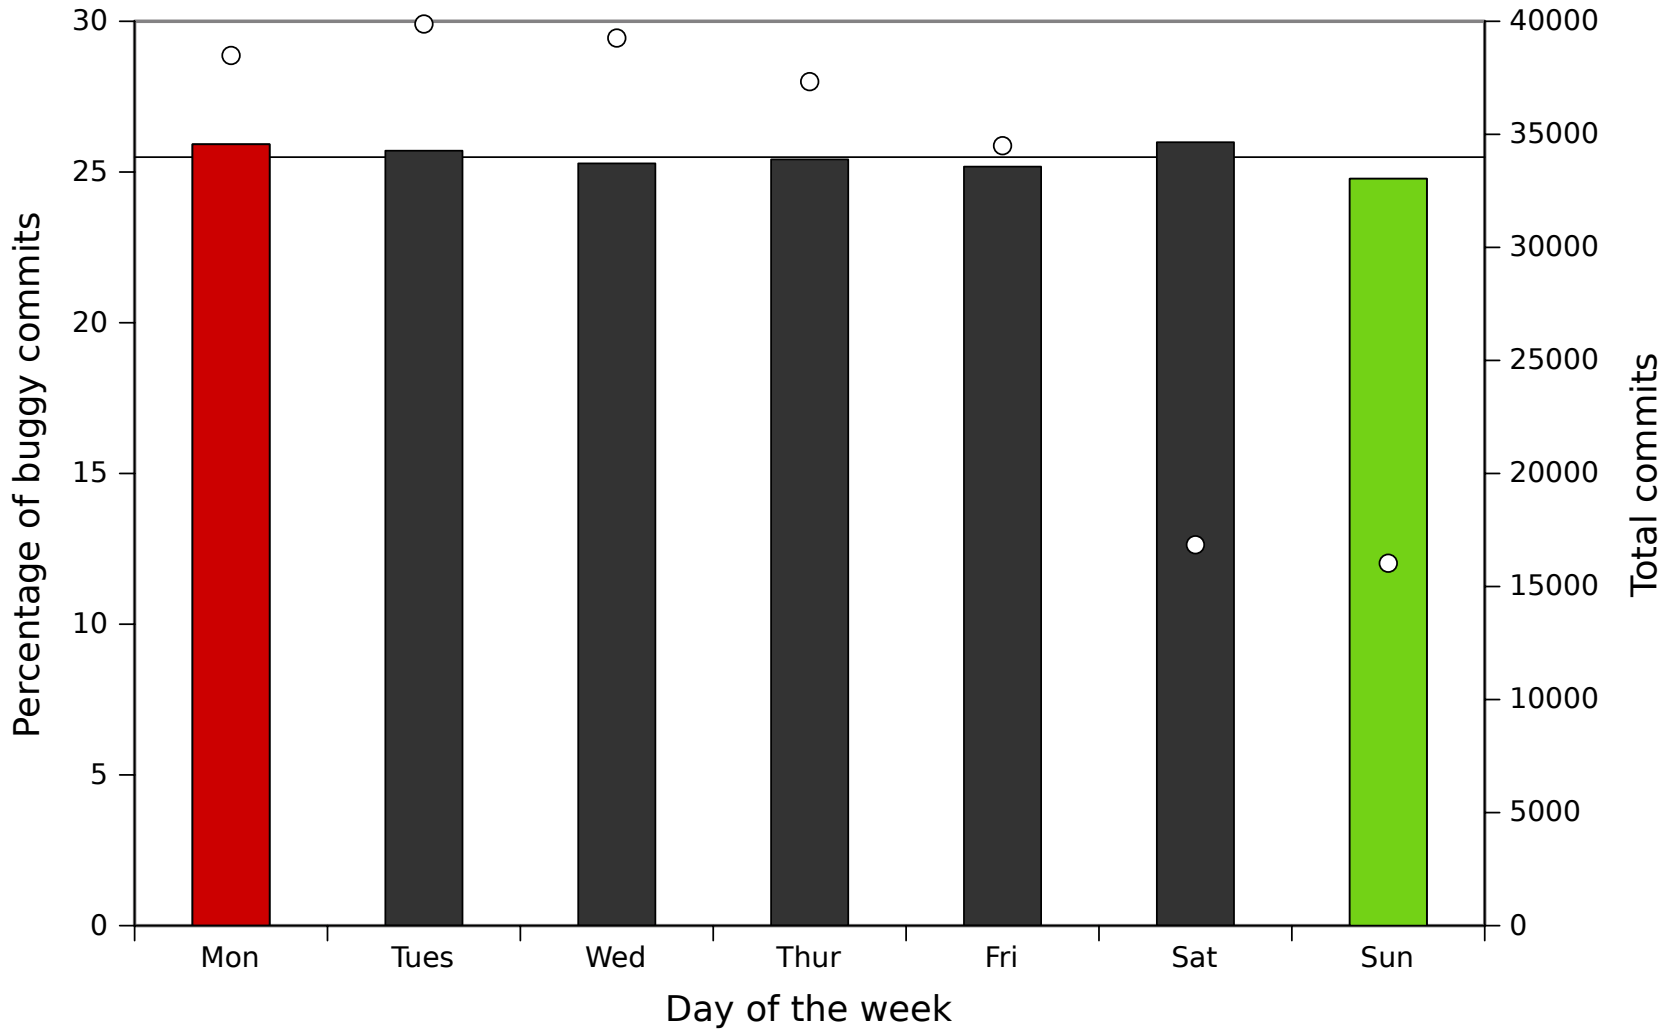
Differences for Inexperienced and Experienced Linux Developers (2)



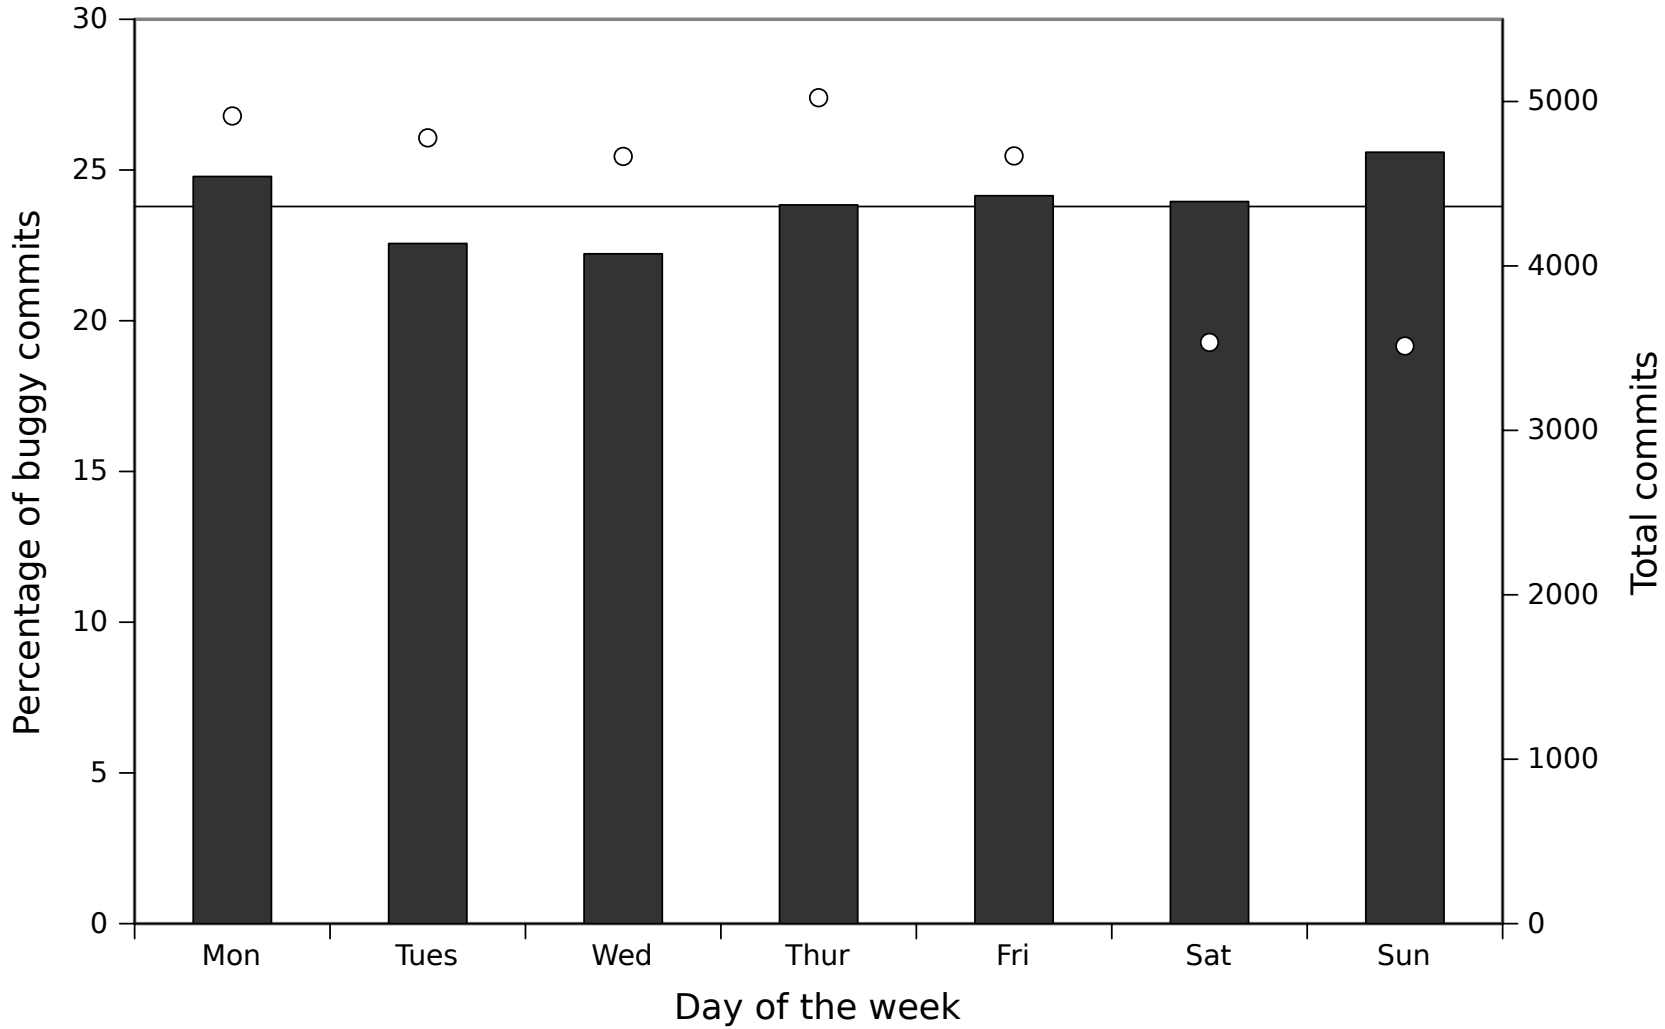
Is a "Case of the Mondays" True for Linux?



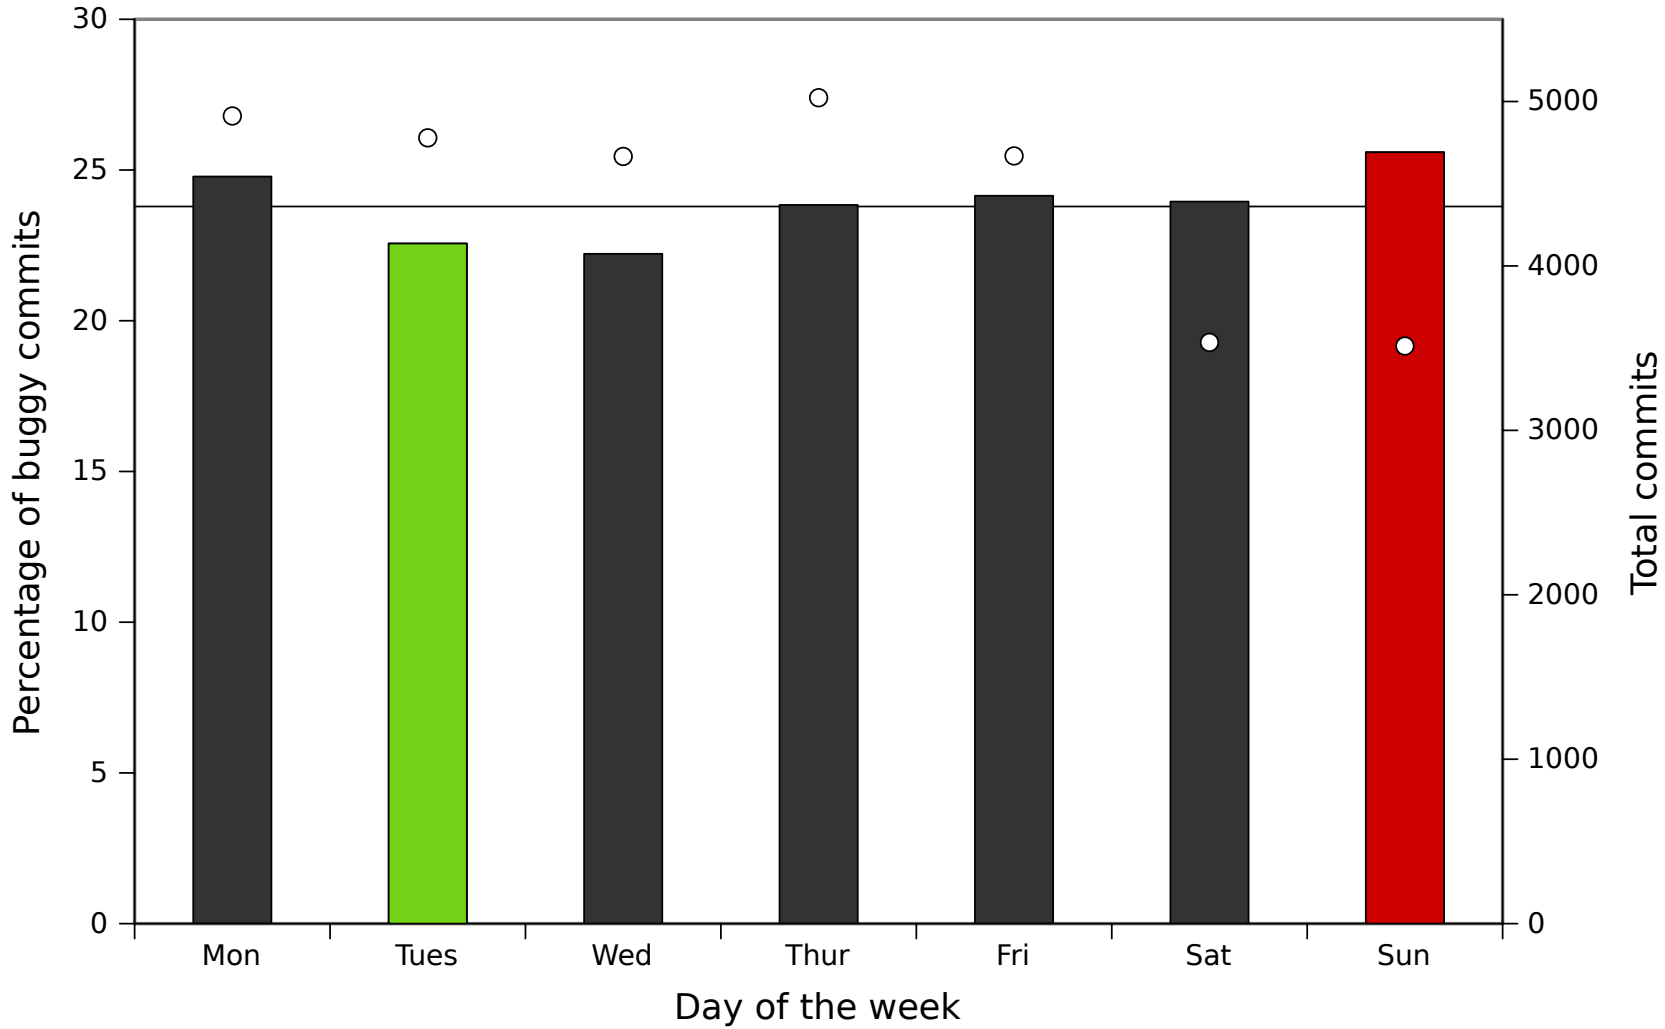
Is a "Case of the Mondays" True for Linux?



What are the Worst Days for PostgreSQL?



What are the Worst Days for PostgreSQL?



Definition

Bug lifetime is the number of days from a fixing commit to the earliest bug introducing commit

- Found the average bug lifetime was
  - 1.38 years ($\sigma = 1.35$) for Linux
  - 3.07 years ($\sigma = 3.19$) for PostgreSQL

Previous Studies

- Commits for Eclipse and Mozilla were found to be buggiest on Fridays [Śliwerski et al., 2005, MSR]
- Classification of commits into different categories [Hindle et al., 2008, MSR]
- Bug lifetimes for Linux and PostgreSQL [Engler et al., 2001, Kim and Whitehead Jr, 2006, MSR]

For the Future

- Study individual developers
  - Are commits outside their normal schedule worse?
  - Experience including other open-source projects?
- More software projects
- Correlations involving code quality
- Data is available and browsable at `http://www.eyolfson.com/scc/`

Summary of Findings

- Commits between midnight and 4 AM are more likely to be buggy
- Commits between 7 AM and noon are less likely to be buggy
- More active developers commit fewer bugs
- More experienced developers commit fewer bugs
- The worst day of the week varies between projects
